

The ribbon — box width is shot length

Every box is drawn at the width of its screen time (0.150"/s), wrapping like text. A 16-second hold gives you a wide panel and demands a composition that survives it; an 8-second aftermath gives you a sliver and forbids one. Draw inside the time you actually have — the sheet makes over-designing a short shot physically uncomfortable, which is the point. Top border: solid = Movement I, double = II, dotted = III.

Two uses: thumbnail the whole film in order at true proportion, or cut the boxes out and re-order them on the desk — the interleave of the swim and the battle was decided exactly this way. Re-ordering here costs scissors; after Gate C it costs generations.
